FACILITY: VAX/VMS MONITOR Utility

ABSTRACT:

Called at request initialization time to obtain Collection and Stat buffers

ENVIRONMENT: Unprivileged user mode.

AUTHOR: Henry M. Levy , CREATION DATE: 28-March-1977 Thomas L. Cafarella

MODIFIED BY:

GET_BUffERS - Obtain Collection & Stat Buffers \$\$MONCODE,NOWRT,EXE 0000000 ;++

FUNCTIONAL DESCRIPTION:

Standard classes:

This routine obtains a number of collection and statistical buffers using the LIB\$GET_VM facility. For heterogeneous classes, the number of buffers obtained is determined by the 3 symbols COLL_BUFS, REG_BUFS and PC_BUFS. The buffers are contiguous, forming a block which includes at its beginning, a set of longword pointers to the buffers which follow immediately thereafter. The buffer block always includes COLL_BUFS collection buffers and REG_BUFS regular stats buffers. If percent data is being maintained, PC_BUFS percent stats buffers are also included. The buffer block is pointed to by CDR\$A_RUFFERS. CDB\$A_BUFFERS.

for homogeneous classes, the entire buffer block above is repeated once for each item being displayed. A set of contiguous pointers to the buffer blocks is stored immediately preceding the blocks, and is pointed to by CDB\$A_BUFFERS. In addition, following the buffer blocks are the SCB (STATS Control Block) and Element ID Table.

Non-standard class (PROCESSES):

For the regular PROCESSES display, only one collection buffer, and the display buffer will be obtained.

For the TOP PROCESSES displays, one collection buffer and the 5 arrays (DATA, DIFF, ORDER, PID, ADDR) will be obtained. Space for the FAO control string will also be obtained, but will not be part of the buffer block.

CALLING SEQUENCE:

JSB GET_BUFFERS

INPUTS:

None

IMPLICIT INPUTS:

COLL BUFS global symbol -- number of collection buffers to obtain REG_BUFS global symbol -- number of regular stats buffers to obtain PC_BUFS global symbol -- number of percent stats buffers to obtain MARELTS global symbol -- maximum number of homogeneous elements SPTR -- pointer to SYI (System Information Area)

R6 -- pointer to CDB R7 -- pointer to MRB R11 -- pointer to MCA

The working set limit was 1350 pages.
20622 bytes (41 pages) of virtual memory were used to buffer the intermediate code.
There were 30 pages of symbol table space allocated to hold 364 non-local and 31 local symbols.
584 source lines were read in Pass 1, producing 16 object records in Pass 2.
16 pages of virtual memory were used to define 6 macros.
